

# Class 09: Structural Bioinformatics part 1

Minjun Kang (PID: A69042800)

## The PDB database

The main repository for biomolecular structure data is the Protein Data Bank (PDB):  
<https://www.rcsb.org>

Let's have a quick look at the composition of this database:

```
# Package
library(readr)

# Explore data
df <- read_csv('data.csv')
```

```
Rows: 6 Columns: 9
-- Column specification -----
Delimiter: ","
chr (1): Molecular Type
dbl (4): Integrative, Multiple methods, Neutron, Other
num (4): X-ray, EM, NMR, Total

i Use `spec()` to retrieve the full column specification for this data.
i Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

Q1. What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy

It is about 81.43% and 12.27% for X-Ray and Electron Microscopy, respectively.

```
tot <- sum(df$Total)
part <- sum(df$'X-ray')
print(round(part/tot * 100, 2))
```

```
[1] 81.43
```

```
part <- sum(df$EM)
print(round(part/tot * 100, 2))
```

```
[1] 12.27
```

Q2. What proportion of structures in the PDB are protein only?

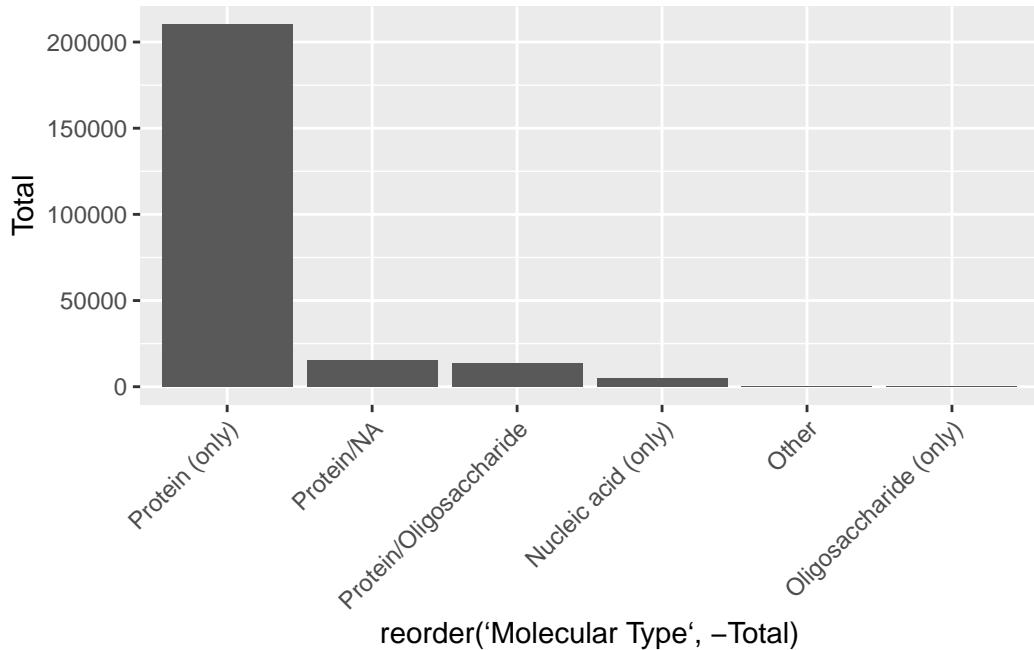

It is about 86.05%

```
part <- sum(df$Total[1])
print(round(part/tot * 100, 2))
```

```
[1] 86.05
```

Q3. Make a bar plot overview of Molecular type.

```
# For basic version
library(ggplot2)
ggplot(df, aes(x=reorder(`Molecular Type`, -Total), y=Total)) +
  geom_col() +
  theme(axis.text.x = element_text(angle = 45, hjust = 1))
```

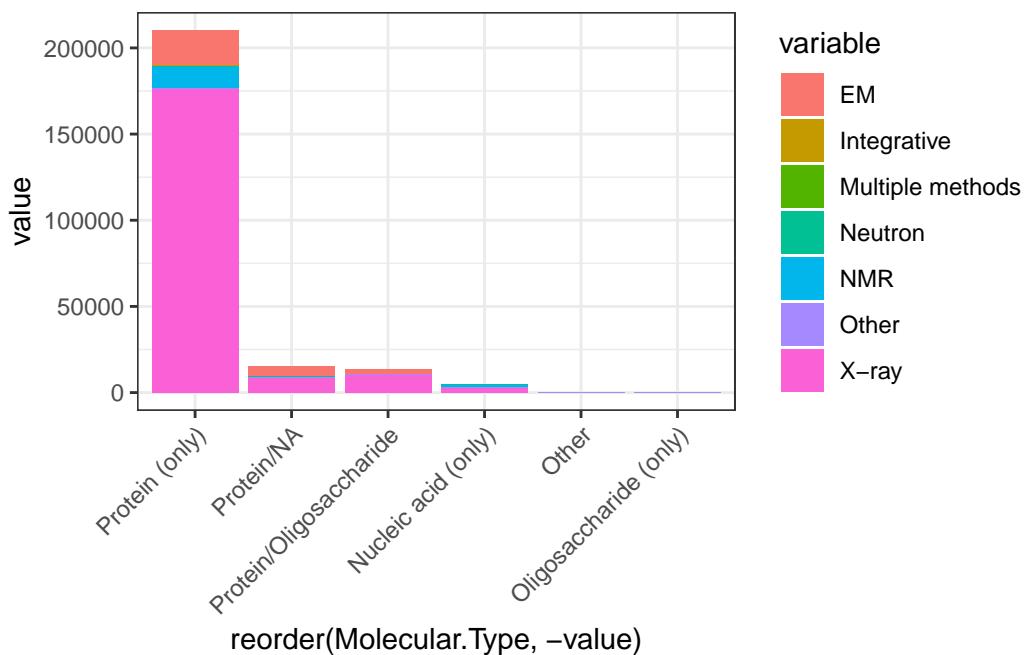

```

# For colored version
df_long <- data.frame(
  `Molecular.Type` = rep(df$`Molecular Type`, times = ncol(df) - 2),
  variable = rep(names(df)[2:8], each = nrow(df)),
  value = c(df$`X-ray`, df$EM, df$NMR, df$Integrative, df$`Multiple methods`, df$Neutron, df$Other)
)

ggplot(df_long, aes(x = reorder(Molecular.Type, -value), y = value, fill = variable)) +
  geom_col() +
  theme_bw() +
  theme(axis.text.x = element_text(angle = 45, hjust = 1))

```

## Visualizing structure data

The Mol\* viewer is embedded in many bioinformatics websites. The homepage is <https://molstar.org>.

I can insert any figure or image file using markdown format.

Figure 1: The HIV-Pr dimer with bound inhibitor

```
## Bio3D package for structural bioinformatics
```

We can use the bio3d package to read and analyze biomolecular data in R:

```
library(bio3d)  
  
hiv <- read.pdb("1HSG")
```

Note: Accessing on-line PDB file

```
head(hiv$atom)
```

	type	eleno	elety	alt	resid	chain	resno	insert	x	y	z	o	b

```

Let's trim to chain A and get just it's sequence:

```
chainA <- trim.pdb(hiv, chain="A")
chainA.seq <- pdbseq(chainA)
```

Let's blast

```
blast <- blast.pdb(chainA.seq)
```

```
Searching ... please wait (updates every 5 seconds) RID = G58SVCDZ014
..
Reporting 249 hits
```

```
head(blast$hit.tbl)
```

## Prediction of functional motions

We can run an Normal Mode Analysis (NMA) to predict large scale motions/flexibility/dynamics of any biomolecule that we can read into R.

Let's look ADK and chain A only!

```
adk <- read.pdb("1ake")
```

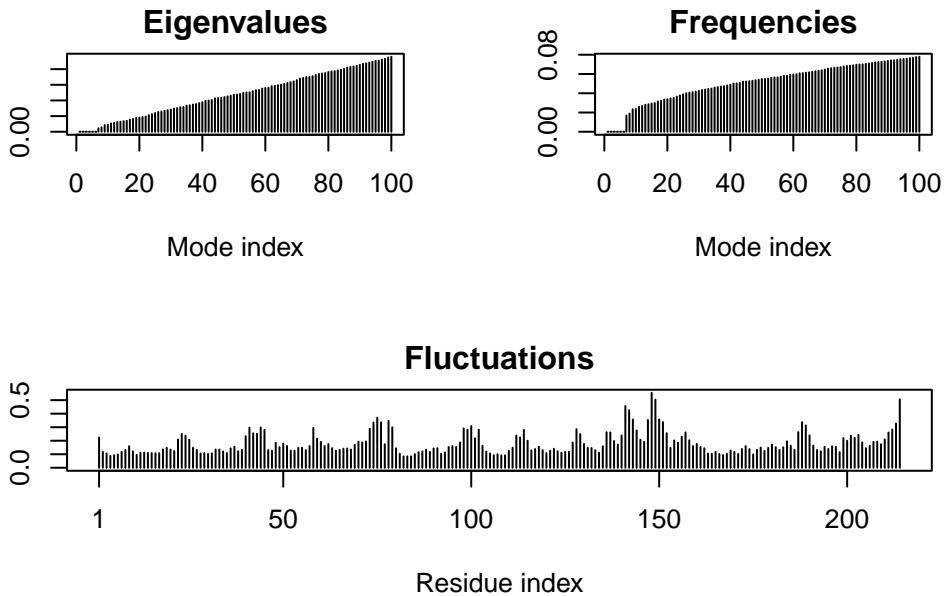

```
Note: Accessing on-line PDB file
PDB has ALT records, taking A only, rm.alt=TRUE
```

```
adk_A <- trim.pdb(adk, chain="A")
```

```
m <- nma(adk_A)
```

```
Building Hessian...      Done in 0.011 seconds.
Diagonalizing Hessian... Done in 0.257 seconds.
```

```
plot(m)
```

Let's write out a “trajectory” of predicted motion

```
mktrj(m, file="adk_nma.pdb")
```

### Play with 3D viewing in R

We can use the new **bio3dview** package, which is not yet on CRAN, to render interactive 3D views in R and HTML quarto output reports.

To install from Github, we can use the **pak** package.

```
library(bio3dview)
#view.pdb(adk)
```
